

DOES YOUR MACHINE HAVE A DUAL ENGINE DESIGN?

DUAL ENGINE DESIGN RAISES THE POWER

Vac-Con's unique 2-engine design uses the chassis engine to drive the vacuum where you really need the power. And the auxiliary engine for the water system delivers continuous, complete water recirculation when you're in motion or resting.

This 2-engine design allows the convenience of truly independent vacuum and water system operation. That means the velocity of each system can be set at the ideal rate for each project. Just one more reason why Vac-con is truly better by design.

Ask for a demonstration today, and see for yourself why choosing a Vac-Con means... **More Power to You!**
